# Project Forming Report

Establishing procedures, choosing tools,  
estimating workload, planning human resources

---

---

## Summary

The purpose of this report is to document processes and management actions for the cAuth project.

## Licensing

We decided to use Apache License 2.0 for code and documents as it is flexible, includes commercial use, private use, distribution, requires propagation under the same license and limits trademark use and liability.

## Licenses purchased

We have purchased a license for Miro (<https://miro.com/>), to be able to work cooperatively on the project.

---

## **Domains purchased**

Domains cauh.org and cauth.id have been purchased for the project.

## **Code and document repository**

We decided to use Github for code and documents. We have private repositories for current work, we use GH issues and milestones to track progress. All deliverables are made available through public repository: <https://github.com/Project-Catalyst/cauth-deliverables>

## **Communications**

We are using Discord as our primary communication medium. Further down the line we plan to create a Twitter account for announcing information about the project.
